

# ALES VARABYOU, Ph.D.

## Genomics Research Scientist and Engineer

[ales.varabyou@jhu.edu](mailto:ales.varabyou@jhu.edu) | (443)531-2179 | [LinkedIn](#) | [GitHub](#) | [Personal Page](#) | Baltimore, MD

I develop open-source algorithms and pipelines for large-scale DNA and RNA sequencing analysis, with a focus on performance and reproducibility. My work covers genome annotation, multi-sample RNA-seq processing, protein discovery, and viral genome analysis. I am the lead developer of CHESS, the first evidence-based human gene catalog built from 20,000+ RNA-seq experiments now integrated into major databases. I currently lead the HIV Atlas project, creating the first reference annotation for thousands of viral genomes. Outside research, I apply my scientific training and curiosity to master culinary techniques and ingredients.

---

## PROFESSIONAL EXPERIENCE

### Research Scientist | Pertea Lab, Johns Hopkins University | 2023 - Present

- **Launched and led [HIV Atlas](#) collaboration:**
  - Designed algorithms for genome annotation transfer in hypervariable viral genomes (Vira, Python) and by-reference correction of spliced alignments (Snapper, Python).
  - Built first HIV-1 reference genome annotation and scaled to thousands of clinical isolates.
  - Created React-based single-page interface for interactive exploration of the data.
- **Spliced alignment of chimeric RNA:**
  - Produced the first account of viral integration activity during acute stages of viremia in macaques infected with SIV.
  - In collaboration with scientists from HJF/WRAIR/MHRP developed [IRIS](#) (Python, Rust) - a splice-aware chimeric RNA identification software.
- **Supervised** graduate, undergraduate and high school students research into transcriptome quantification, transcriptome quantification, metagenomic database curation and genome annotation.
- Designed a SQL/Flask/React comparative transcriptomics [web platform](#) for creating custom genome annotations from multiple sources (CHESS, RefSeq, ENSEMBL, MANE, FANTOM).

### Graduate Research Assistant | Salzberg Lab, Johns Hopkins University | 2017 - 2023

- **[CHESS](#) genome catalogue project lead for 7+ years:**
  - Designed a sample-to-annotation protocol for condition specific gene, transcript and protein finding.
  - Identified and characterized tens of thousands of conditions-specific transcriptional products from 20,000+ RNA-seq experiments across 54 tissue types.
- **Data compression and representation with [TieBrush](#) (Rust, C++):**
  - Designed and developed a suite of tools for multi-sample processing of TB-scale sequencing datasets, reducing processing time and storage requirements by 85%.
  - Identified key predictors of functional and noisy splicing signals in RNA-seq data.
  - Developed ML model to predict valid splice sites improving assembly specificity by over 40%.
- **Protein prediction with [ORFanage](#) (C++):**
  - **Designed and developed** an ultra-efficient and sensitive system for protein prediction in novel transcripts achieving >95% accuracy.
  - Predicted novel proteins and validated function with PhyloCSF and AlphaFold2.
- **Designed and implemented [Bolotie](#) (C++)** - the first algorithm capable of detecting recombination across millions of viral genomes using Markov Model trained on millions of sequences.

# EDUCATION

## Ph.D. in Computer Science (Genomics)

Johns Hopkins University | 2017 – 2023

Advisors: Dr. Steven Salzberg & Dr. Mihaela Pertea

Thesis: Computational Study of Transcriptional Landscapes from RNA-seq Data

**M.Sc.Eng. in Computer Science** | Johns Hopkins University | 2017 – 2020

**Honors B.A. in Biology and Computer Science** | Luther College | 2013 – 2017

---

# EXPERTISE

## Genomics & Bioinformatics

- 10+ years developing custom algorithms for RNA-seq (bulk, single-cell, spatial) and DNA-seq analysis.
- Applied experience developing and deploying end-to-end bioinformatics workflows: from DNA and RNA alignment and assembly to differential expression, clustering and metagenomic classification.
- Closely familiar with unique challenges, advantages and needs of various flavors of sequencing data including short-read Illumina, error-prone Oxford Nanopore and recent PacBio DNA and RNA-seq data.
- Skilled in creating publication-quality data visualizations (matplotlib, ggplot) and interactive web interfaces (React, D3.js).

**Programming:** Python | C++ | Rust | shell | Unix | R | OpenMP | SQL | Docker | Singularity | Git | D3js

**Languages:** Belarusian (Native) | English (Native) | Russian (Native) | Polish (Conversational)

# SERVICE & LEADERSHIP

- **Invited Speaker:** *Harvard University, Banbury Conference, Yale University, Medical School Intensive*
- **Peer Review:** *Nature, Genome Biology, ISMB/ECCB, MBE, NAR, OUP Bioinformatics and more.*
- **Open-Source Contributions:** MUMmer4, gffread, gffcompare and more
- **Technical advisor** on variant calling and predictive modeling for Aevus Diagnostics.
- **JHU Transportation Initiative:** Designed and implemented a [real-time tracking system](#) to improve accountability and reliability for the JHU campus shuttle service.
- **University Leadership:** Represented graduate students on the Provost's Advisory Team on Healthcare, successfully advocating for improved university-wide health insurance policies.
- **Member** of the Belarus National UWC (United World Colleges) Committee.
